

# C Developer

*Discover the C Syntax*

# *Course Objectives*

- ✓ Declare and handle variables
- ✓ Manage inputs and outputs

# *Course Plan*

1. Code Structure
2. Variables
3. Preprocessor Directives
4. Operators

# 1. Code Structure

# 1. Code Structure

## Main

- It is the entry point of the C program
- It must be unique
- Each instruction ends with “;”

# 1. Code Structure

## Main

Start the program without argument

```
#include <stdio.h>
#include <stdlib.h>

int main()
{
    printf("Hello world!\n");
    return 0;
}
```

**./Useless**

# 1. Code Structure

## Main

Start the program with argument(s)

```
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char *argv[])
{
    printf("Hello world!\n");
    return 0;
}
```

```
./Useless arg1
```

```
./Useless arg1 arg2
```

# 1. Code Structure

## Include Libraries

- A program contains many instructions
  - **#include** preprocessor directive
  - **<file.h>** compiler include
- **<stdio.h>**
  - Stands for Standard Input Output
  - Has the information related to input/output functions
- **<stdlib.h>**
  - Stands for Standard Library
  - Has the information of memory allocation/freeing functions

# 1. Code Structure

## Include Libraries

With the default header files, we can print arguments

```
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char *argv[])
{
    for(int i = 0; i < argc; i++) {
        printf("Argument %d = %s\n", i, argv[i]);
    }
    return 0;
}
```

# 1. Code Structure

## Include Libraries

With the default header files, we can print arguments

```
Useless.exe Hello World
```

```
Argument 0 = Useless.exe  
Argument 1 = Hello  
Argument 2 = World
```

# 1. Code Structure

## Comments

To insert a comment, use “//”

```
#include <stdio.h>
#include <stdlib.h>

//A nice comment
int main()
{
    //vwrE3_JsuqM
    printf("Hello world!\n");
    return 0;
}
```

# 1. Code Structure

## Comments

To insert a block of comments, use “/\* ... \*/”

```
#include <stdio.h>
#include <stdlib.h>

int main()
{
    /*
    Monke
    M69Sn30ERZo
    */
    printf("Hello world!\n");
    return 0;
}
```

# 1. Code Structure

## Exercise

- Create a new Code::Blocks C project named “*HelloArgument*”
- Print “*Hello SUPINFO!*”
- Print only 5 arguments

# 1. Code Structure

## Questions

## 2. Variables

## 2. Variables

### Introduction

To use information, you must know how it is encoded in memory:

- Integer
- Decimal
- Character

There is no boolean type!

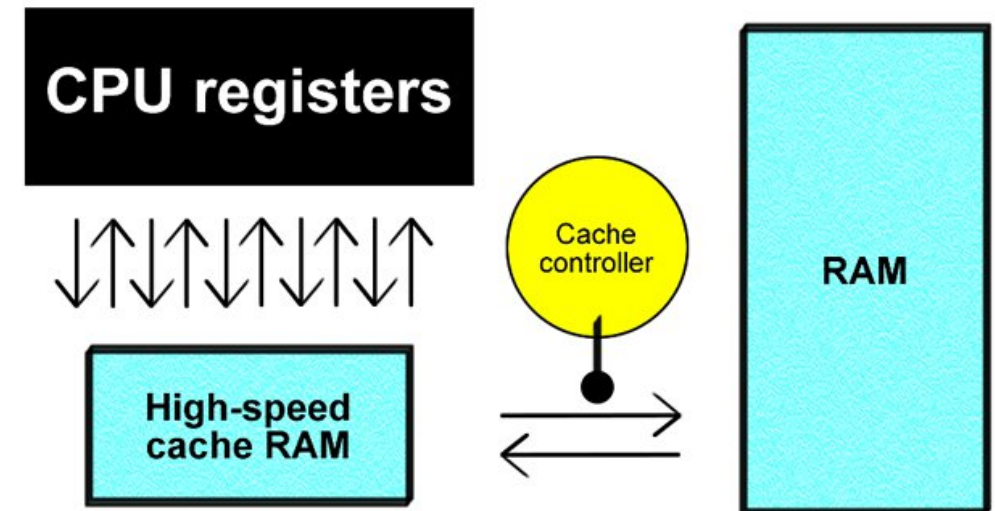

## 2. Variables

### Introduction

- All variables are numbers in memory
- Memories are binary (Register, Cache, RAM)
- Information is stored by a sequence of 0 and 1

## 2. Variables

### Introduction

A representation of the memory

| Address | Value |
|---------|-------|
| 0000    | 1337  |
| 0001    |       |
| 0002    | a     |
| 0003    | 8     |
| 0004    |       |
| 0005    |       |
| 0006    |       |
| 0007    | 42    |

## 2. Variables

### Integer

| Type                     | Size (min)       | Min                        | Max                         |
|--------------------------|------------------|----------------------------|-----------------------------|
| short                    | 2 bytes/16 bits  | -32 768                    | +32 767                     |
| unsigned short           | 2 bytes/16 bits  | 0                          | +65 535                     |
| int                      | 4 bytes/32 bits* | -2 147 483 648             | +2 147 483 647              |
| unsigned int             | 4 bytes/32 bits* | 0                          | +4 294 967 295              |
| long                     | 4 bytes/32 bits  | -2 147 483 648             | +2 147 483 647              |
| unsigned long            | 4 bytes/32 bits  | 0                          | +4 294 967 295              |
| long long (C99)          | 8 bytes/64 bits  | -9 223 372 036 854 775 808 | +9 223 372 036 854 775 807  |
| unsigned long long (C99) | 8 bytes/64 bits  | 0                          | +18 446 744 073 709 551 615 |

## 2. Variables

### Integer

Example of **unsigned short**:

| Decimal | Binary (in memory) | Hexadecimal |
|---------|--------------------|-------------|
| 1       | 00000000 00000001  | 0001        |
| 2       | 00000000 00000010  | 0002        |
| 3       | 00000000 00000011  | 0003        |
| ...     | ...                | ...         |
| 65 534  | 11111111 11111110  | FFFE        |
| 65 535  | 11111111 11111111  | FFFF        |

## 2. Variables

### Integer

Example of **signed short**:

| Decimal | Binary (in memory) | Hexadecimal |
|---------|--------------------|-------------|
| 32 767  | 01111111 11111111  | 7FFF        |
| ...     | ...                | ...         |
| 1024    | 00000100 00000000  | 0400        |
| ...     | ...                | ...         |
| 0       | 00000000 00000000  | 0000        |
| -1      | 11111111 11111111  | FFFF        |
| ...     | ...                | ...         |
| -1024   | 11111100 00000000  | FC00        |
| ...     | ...                | ...         |
| -32 768 | 10000000 00000000  | 8000        |

## 2. Variables

### Integer

- A good developer does not allocate more memory than necessary
- The program will be more efficient
- Choose the right type of variable

## 2. Variables

### Decimal

| Type        | Size (min)        | Precision (decimal) | Min       | Max       |
|-------------|-------------------|---------------------|-----------|-----------|
| float       | 4 bytes/32 bits   | 6                   | 1.2E-38   | 3.4E+38   |
| double      | 8 bytes/64 bits   | 15                  | 2.3E-308  | 1.7E+308  |
| long double | 12 bytes/96 bits* | 18                  | 3.4E-4932 | 1.1E+4932 |

Real numbers are represented either in decimal form or using a power of 10:

$$280.61 = 2.8061e2 = 28061E-2$$

## 2. Variables

### Character

- A character is a number
  - The letter “**A**” (uppercase) is stored as **65** in the memory (ASCII)
- A **char** is a representation of a character of an integer from **-128** to **127**
- An **unsigned char** is a representation of a character of an integer from **0** to **255**

## 2. Variables

### Character

### ASCII table

| Dec | Hx | Oct | Char                               | Dec | Hx | Oct | Html  | Chr   | Dec | Hx | Oct | Html  | Chr | Dec | Hx | Oct | Html   | Chr |
|-----|----|-----|------------------------------------|-----|----|-----|-------|-------|-----|----|-----|-------|-----|-----|----|-----|--------|-----|
| 0   | 0  | 000 | <b>NUL</b> (null)                  | 32  | 20 | 040 | &#32; | Space | 64  | 40 | 100 | &#64; | @   | 96  | 60 | 140 | &#96;  | `   |

| 13  | D  | 015 | <b>CR</b> (carriage return)        | 45  | 2D | 055 | &#45; | -     | 77  | 4D | 115 | &#77; | M   | 109 | 6D | 155 | &#109; | m   |
| 14  | E  | 016 | <b>SO</b> (shift out)              | 46  | 2E | 056 | &#46; | .     | 78  | 4E | 116 | &#78; | N   | 110 | 6E | 156 | &#110; | n   |
| 15  | F  | 017 | <b>SI</b> (shift in)               | 47  | 2F | 057 | &#47; | /     | 79  | 4F | 117 | &#79; | O   | 111 | 6F | 157 | &#111; | o   |
| 16  | 10 | 020 | <b>DLE</b> (data link escape)      | 48  | 30 | 060 | &#48; | 0     | 80  | 50 | 120 | &#80; | P   | 112 | 70 | 160 | &#112; | p   |
| 17  | 11 | 021 | <b>DC1</b> (device control 1)      | 49  | 31 | 061 | &#49; | 1     | 81  | 51 | 121 | &#81; | Q   | 113 | 71 | 161 | &#113; | q   |
| 18  | 12 | 022 | <b>DC2</b> (device control 2)      | 50  | 32 | 062 | &#50; | 2     | 82  | 52 | 122 | &#82; | R   | 114 | 72 | 162 | &#114; | r   |
| 19  | 13 | 023 | <b>DC3</b> (device control 3)      | 51  | 33 | 063 | &#51; | 3     | 83  | 53 | 123 | &#83; | S   | 115 | 73 | 163 | &#115; | s   |
| 20  | 14 | 024 | <b>DC4</b> (device control 4)      | 52  | 34 | 064 | &#52; | 4     | 84  | 54 | 124 | &#84; | T   | 116 | 74 | 164 | &#116; | t   |
| 21  | 15 | 025 | <b>NAK</b> (negative acknowledge)  | 53  | 35 | 065 | &#53; | 5     | 85  | 55 | 125 | &#85; | U   | 117 | 75 | 165 | &#117; | u   |
| 22  | 16 | 026 | <b>SYN</b> (synchronous idle)      | 54  | 36 | 066 | &#54; | 6     | 86  | 56 | 126 | &#86; | V   | 118 | 76 | 166 | &#118; | v   |
| 23  | 17 | 027 | <b>ETB</b> (end of trans. block)   | 55  | 37 | 067 | &#55; | 7     | 87  | 57 | 127 | &#87; | W   | 119 | 77 | 167 | &#119; | w   |
| 24  | 18 | 030 | <b>CAN</b> (cancel)                | 56  | 38 | 070 | &#56; | 8     | 88  | 58 | 130 | &#88; | X   | 120 | 78 | 170 | &#120; | x   |
| 25  | 19 | 031 | <b>EM</b> (end of medium)          | 57  | 39 | 071 | &#57; | 9     | 89  | 59 | 131 | &#89; | Y   | 121 | 79 | 171 | &#121; | y   |
| 26  | 1A | 032 | <b>SUB</b> (substitute)            | 58  | 3A | 072 | &#58; | :     | 90  | 5A | 132 | &#90; | Z   | 122 | 7A | 172 | &#122; | z   |
| 27  | 1B | 033 | <b>ESC</b> (escape)                | 59  | 3B | 073 | &#59; | :     | 91  | 5B | 133 | &#91; | [   | 123 | 7B | 173 | &#123; | {   |
| 28  | 1C | 034 | <b>FS</b> (file separator)         | 60  | 3C | 074 | &#60; | <     | 92  | 5C | 134 | &#92; | \   | 124 | 7C | 174 | &#124; |     |
| 29  | 1D | 035 | <b>GS</b> (group separator)        | 61  | 3D | 075 | &#61; | =     | 93  | 5D | 135 | &#93; | ]   | 125 | 7D | 175 | &#125; | }   |
| 30  | 1E | 036 | <b>RS</b> (record separator)       | 62  | 3E | 076 | &#62; | >     | 94  | 5E | 136 | &#94; | ^   | 126 | 7E | 176 | &#126; | ~   |
| 31  | 1F | 037 | <b>US</b> (unit separator)         | 63  | 3F | 077 | &#63; | ?     | 95  | 5F | 137 | &#95; | _   | 127 | 7F | 177 | &#127; | DEL |

## 2. Variables

### Character

- The characters from 32 to 126 can be displayed as follows:

```
!"#$%&'()*+,-./  
0123456789:;<=>?  
@ABCDEFGHIJKLMNO  
PQRSTUVWXYZ[\]^_  
`abcdefghijklmnopqrstuvwxyz{|}~
```

- To manipulate a character, you can use “ ' ... ' ”
  - **36** and **'\$'** are identical (just like **'\x24'** for hexadecimal lovers)
- String handling is a bit tricky

## 2. Variables

### Character

Some non-displayable characters can also be designated without their ASCII code, using a “\” between quotes

| Escape Sequence | ASCII Code (Decimal) | ASCII Code (Hexadecimal) | Meaning         |
|-----------------|----------------------|--------------------------|-----------------|
| \n              | 10                   | A                        | New Line        |
| \t              | 9                    | 9                        | Horizontal Tab  |
| \b              | 8                    | 8                        | Backspace       |
| \r              | 13                   | D                        | Carriage Return |
| \a              | 7                    | 7                        | (Alert) Bell    |
| \'              | 39                   | 27                       | Single Quote    |
| \"              | 34                   | 22                       | Double Quote    |
| \?              | 63                   | 3F                       | Question Mark   |
| \\              | 92                   | 5C                       | Backslash       |
| \f              | 12                   | C                        | Form Feed       |
| \v              | 11                   | B                        | Vertical Tab    |
| \0              | 0                    | 0                        | Null Character  |

## 2. Variables

### Summary

- char
- unsigned char
- short
- unsigned short
- int
- unsigned int
- long
- unsigned long
- long long
- unsigned long long
- float
- double
- long double

**Hierarchy**

## 2. Variables

### Declaration and assignment

Variable can be declared as:

- Global (available anywhere)
- Local (available in the current scope)

```
#include <stdio.h>
#include <stdlib.h>

int i; //A global variable

int main()
{
    char j; //A local variable
    return 0;
}
```

## 2. Variables

### Declaration and assignment

The assignment:

- can be made during the declaration or later in the program
- is done with the “=” operator

```
#include <stdio.h>
#include <stdlib.h>

int main()
{
    int i;
    char j = 'A';
    i = 666;
    return 0;
}
```

## 2. Variables

### Declaration and assignment

- You can assign the value of a variable of a certain type to a variable of another type
- This implicit conversion is carried out without or with loss of information

```
#include <stdio.h>
#include <stdlib.h>

int main()
{
    int n = 8;
    double x = n;
    double y = 123.45;
    int m = y;
    return 0;
}
```

n = 8  
x = 8  
y = 123.45  
m = 123

## 2. Variables

### Convention

- The name of a variable is referred as an identifier
- It must follow some rules:
  - It can contain letters (uppercase or lowercase), digits and underscores “\_”
  - The first character must be a letter or an underscore (but avoid it for the last)
  - Most C compilers have a limit of 255 characters for an identifier, but ANSI standard recognizes a length of **31 characters** for a variable name
- Underscore is used to separate elements of an identifier
- Uppercase letters are recommended for ease of reading

## 2. Variables

### Convention

- Do not use reserved keywords!

|          |        |         |        |          |          |
|----------|--------|---------|--------|----------|----------|
| auto     | break  | case    | char   | const    | continue |
| default  | do     | double  | else   | enum     | extern   |
| float    | for    | goto    | if     | int      | long     |
| register | return | short   | signed | sizeof   | static   |
| struct   | switch | typedef | union  | unsigned | void     |
| volatile | while  |         |        |          |          |

- C variable is case-sensitive
- Use a descriptive variable name and prefer to start with a lowercase letter

## 2. Variables

### Display a variable

- Use the **stdio** header and the **printf** function

```
#include <stdio.h>

int main()
{
    printf("It displays stuff...\n");
    return 0;
}
```

It displays stuff...

## 2. Variables

### Display a variable

- To display variables, use a format specifier of variable type
  - **int** with the format specifier **%d**

```
#include <stdio.h>

int main()
{
    int i = 42;
    printf("The value is: %d\n", i);
    return 0;
}
```

The value is: 42

## 2. Variables

### Display a variable

- **%x** or **%X** to convert in hexadecimal, **%o** in octal

```
#include <stdio.h>

int main()
{
    int i = 42;
    printf("The value is: %d\n", i);
    printf("The value is: %x\n", i);
    printf("The value is: %X\n", i);
    printf("The value is: %o\n", i);
    return 0;
}
```

```
The value is: 42
The value is: 2a
The value is: 2A
The value is: 52
```

## 2. Variables

### Display a variable

- **float** with the format specifier **%f** (**%e** or **%E** to use the scientific notation)

```
#include <stdio.h>

int main()
{
    float i = 42.667;
    printf("The value is: %f\n", i);
    printf("The value is: %e\n", i);
    printf("The value is: %E\n", i);
    return 0;
}
```

```
The value is: 42.667000
The value is: 4.266700e+001
The value is: 4.266700E+001
```

## 2. Variables

### Display a variable

- **char** with the format specifier **%c**

```
#include <stdio.h>

int main()
{
    int i = 65;
    char j = 65;
    char k = 'A';
    printf("The character is: %c\n", i);
    printf("The character is: %c\n", j);
    printf("The character is: %c\n", k);
    return 0;
}
```

```
The character is: A
The character is: A
The character is: A
```

## 2. Variables

### Display a variable

- You can display multiple variables with the same **printf**

```
#include <stdio.h>

int main()
{
    int i = 65;
    char k = 'A';
    printf("The character %c is %d in ASCII\n", k, i);
    printf("The character %c is %d in ASCII\n", k, k);
    return 0;
}
```

```
The character A is 65 in ASCII
The character A is 65 in ASCII
```

## 2. Variables

### Format specifier examples

| Data Type          | Format Specifier |
|--------------------|------------------|
| char               | %c               |
| unsigned char      | %c               |
| short              | %hd              |
| unsigned short     | %hu              |
| int                | %d               |
| unsigned int       | %u               |
| long               | %ld              |
| unsigned long      | %lu              |
| long long          | %lld             |
| unsigned long long | %llu             |
| float              | %f               |
| double             | %lf              |
| long double        | %Lf              |
| string             | %s               |

## 2. Variables

### Read a variable

- Use the **stdio** header and the **scanf** function to request an input
- Use a format specifier of variable type
- Specify the address of the variable in the computer's memory
- To display text related to the request, you need to use **printf**

## 2. Variables

### Read a variable

```
#include <stdio.h>

int main()
{
    int i;
    float j;
    printf("Enter the int value: ");
    scanf("%d", &i);
    printf("The int value is: %d\n\n", i);
    printf("Enter the float value: ");
    scanf("%f", &j);
    printf("The float value is: %f\n", j);
    return 0;
}
```

Enter the int value: 42

The int value is: 42

Enter the float value: 13.5

The float value is: 13.500000

## 2. Variables

### Read a variable

- You can request multiple variables with the same **scanf**

```
#include <stdio.h>
```

```
int main()  
{
```

```
    int i;
```

```
    float j;
```

```
    printf("Enter the int value then the float value: ");
```

```
    scanf("%d%f", &i, &j);
```

```
    printf("The int value is: %d\n", i);
```

```
    printf("The float value is: %f\n", j);
```

```
    return 0;
```

```
}
```

```
Enter the int value then the float value: 42
```

```
13.5
```

```
The int value is: 42
```

```
The float value is: 13.500000
```

## 2. Variables

### Constants

- Use the **const** keyword
- Do the assignment immediately

```
#include <stdio.h>

int main()
{
    const float PI = 3.141593;
    printf("The pi value is: %f\n", PI);
    return 0;
}
```

The pi value is: 3.141593

## 2. Variables

### Exercise

- You have the following URL, but 3 parts are missing:

`https://www.youtube.com/watch?v=_WAOx_OmR_`

- Display the URL using the following variables at the missing places:
  - The character associated with the ASCII decimal value 51
  - The character associated with the ASCII hexadecimal value 4B
  - The ASCII decimal value associated with the character Z

## 2. Variables

### Questions

# 3. Preprocessor Directives

### 3. Preprocessor Directives

#### **#include**

Both user and system header files are included

- **#include <file>**
  - It is used for system header files
  - It searches for a file named **file** in directories pre-designated by the compiler/IDE (standard system)
  - It is normally used to include standard library header files
- **#include "file"**
  - It is used for header files of your own program
  - It searches for a file named **file** in the same directory as the file containing the directive (or using the relative path) then in pre-designated directories
  - It is normally used to include programmer-defined header files

### 3. Preprocessor Directives

#### **#define**

Define a constant or create a macro

- Define

```
#define SERVER_H
```

- Constant

```
#define SERVER_PORT 1337
```

- Macro without argument

```
#define HELLO() printf("Hello!");
```

- Macro with argument(s)

```
#define HELLO(name) printf("Hello %s!", name);
```

### 3. Preprocessor Directives

#### Predefined macros

- **\_\_LINE\_\_**: current line number
- **\_\_FILE\_\_**: current file full path
- **\_\_DATE\_\_**: current (compilation) date
- **\_\_TIME\_\_**: current (compilation) time
- **\_\_TIMESTAMP\_\_**  $\approx$  **\_\_DATE\_\_** + **\_\_TIME\_\_**

## 3. Preprocessor Directives

### Conditions

- Check if **SERVER\_H** is defined

```
#ifdef SERVER_H  
    //Hello  
#endif
```

- Check if **SERVER\_H** is not defined

```
#ifndef SERVER_H  
    //Bye  
#endif
```

## 3. Preprocessor Directives

### Conditions

```
//If never included
#ifndef SERVER_H
    //Prevent multiple inclusion
    #define SERVER_H
    #ifdef _WIN32
        //Windows
        #include <winsock2.h>
    #else
        #include <sys/types.h>
    #endif
#endif
```

- The **#error** macro allows you to make compilation fail and issue a statement that will appear in the list of compilation errors

```
#ifdef _WIN32
    #error "Windows is not supported."
#endif
```

# 3. Preprocessor Directives

## Questions

# 4. Operators

## 4. Operators

### Categories

- Arithmetic
- Assignment and incrementation
- Relational
- Logical
- Conditional

## 4. Operators

### Arithmetic

- Arithmetic operators: **+**, **-**, **\***, **/**, **%**
- They are usually defined only for operands of the same type
- When “**/**” is used with two integers, it returns the quotient of the Euclidean division of the first by the second
- The “**%**” operator is only defined with integers and returns the remainder of the Euclidean division of the first by the second

## 4. Operators

### Arithmetic

```
#include <stdio.h>

int main()
{
    double x = 5; double y = 2;
    printf("x/y=%lf\n", x/y);
    int n = 5; int m = 2;
    printf("n/m=%d\n", n/m);
    printf("n%%m=%d\n", n%m);
    return 0;
}
```

```
x/y=2.500000
n/m=2
n%m=1
```

## 4. Operators

### Arithmetic

Reminders about implicit conversions:

- It may happen that we must perform a calculation between a real and an integer; the latter will then be implicitly converted into a real, and the result of the operation will also be real
- More generally, if needed, a variable of a given type can be converted into a “higher” type (float into double for example, and not the other way around)

## 4. Operators

### Arithmetic

```
#include <stdio.h>

int main()
{
    double x = 5.8; int y = 2;
    printf("x/y=%lf\n", x/y);
    return 0;
}
```

x/y=2.900000

## 4. Operators

### Assignment and incrementation

| Assignment shortcuts   |                     |
|------------------------|---------------------|
| <code>x = x + y</code> | <code>x += y</code> |
| <code>x = x - y</code> | <code>x -= y</code> |
| <code>x = x * y</code> | <code>x *= y</code> |
| <code>x = x / y</code> | <code>x /= y</code> |
| <code>x = x % y</code> | <code>x %= y</code> |

```
#include <stdio.h>

int main()
{
    int x = 5; int y = 7;
    x *= y;
    printf("x = %d\n", x);
    return 0;
}
```

**x = 35**

## 4. Operators

### Assignment and incrementation

- To increment or decrement the value of a variable by 1 you can use the operators “++” or “--”
- **n++** and **++n** will thus increment n by 1 but the value of these expressions is however different: **n++** is the value of n before the increment and **++n** is the value of n after the increment
- Likewise with “--”

## 4. Operators

### Assignment and incrementation

```
#include <stdio.h>

int main()
{
    int x = 0, y;
    y = x++;
    printf("x = %d, y = %d\n", x, y);
    return 0;
}
```

x = 1, y = 0

```
#include <stdio.h>

int main()
{
    int x = 0, y;
    y = ++x;
    printf("x = %d, y = %d\n", x, y);
    return 0;
}
```

x = 1, y = 1

## 4. Operators

### Assignment and incrementation

```
#include <stdio.h>

int main()
{
    int m = 0, n = 2; //m = 0 & n = 2
    n++; //m = 0 & n = 3
    m = n++; //m = 3 & n = 4
    m = ++n; //m = 5 & n = 5
    printf("m = %d & n = %d\n", m, n);
    return 0;
}
```

m = 5 & n = 5

## 4. Operators

### Relational

- Relational operators: `==`, `!=`, `<=`, `>=`, `<`, `>`
- They deal with numerical values
- They are subject to the implicit conversion rules
- The result is an integer, worth **0** if the comparison is false, and **1** if it is true

## 4. Operators

### Relational

```
#include <stdio.h>

int main()
{
    int n = 5, m, p;
    double x = 5;
    m = (x == n); //True
    p = (x < 3); //False
    printf("m = %d & p = %d\n", m, p);
    p = 3 * (n <= x); //0 or 3
    printf("p = %d\n", p);
    return 0;
}
```

```
m = 1 & p = 0
p = 3
```

## 4. Operators

### Logical

- Logical operators: **&&**, **||**, **!**
- They correspond to **AND**, **OR** and **NOT**
- They take as operand numerical values with the convention that 0 corresponds to **FALSE** and that any non-zero value corresponds to **TRUE**
- The result is an integer worth 0 (**FALSE**) or 1 (**TRUE**)

## 4. Operators

### Logical – Truth tables

$$z = x \ \&\& \ y$$

| x | y | z |
|---|---|---|
| 0 | 0 | 0 |
| 0 | 1 | 0 |
| 1 | 0 | 0 |
| 1 | 1 | 1 |

$$z = x \ || \ y$$

| x | y | z |
|---|---|---|
| 0 | 0 | 0 |
| 0 | 1 | 1 |
| 1 | 0 | 1 |
| 1 | 1 | 1 |

$$z = !x$$

| x | z |
|---|---|
| 0 | 1 |
| 1 | 0 |

## 4. Operators

### Logical

```
#include <stdio.h>

int main()
{
    int n = 5, m, p, o;
    double x = 5;
    m = (x == n) && (x < 3); //True and False
    p = (x < 4) || (x == 5); //False or True
    o = !(x >= 4); // Not True
    printf("m = %d & p = %d & o = %d\n", m, p, o);
    return 0;
}
```

m = 0 & p = 1 & o = 0

## 4. Operators

### Conditional

- Conditional operator: ?
- You can use the logical and relational operators
- Syntax:

```
myVar = condition ? trueValue : falseValue
```

## 4. Operators

### Conditional

```
#include <stdio.h>

int main()
{
    int x = 5, y = 2;
    int m = ((x == 4) || 13.5) ? x : y;
    printf("m = %d\n", m);
    return 0;
}
```

m = 5

# 4. Operators

## Math functions

#include <math.h>

|      |       |       |       |
|------|-------|-------|-------|
| acos | asin  | atan  | atan2 |
| cos  | cosh  | sin   | sinh  |
| tanh | exp   | frexp | ldexp |
| log  | log10 | modf  | pow   |
| sqrt | ceil  | fabs  | floor |
| fmod |       |       |       |

## 4. Operators

### Exercise

- Ask the user to enter a unit price before tax, a VAT rate and a quantity of items
- Calculate and display the total price including VAT of the purchase

# 4. Operators
